Contents

1 Introduction

```
# this may be needed in some geographic locations as some Windows TZ strings are
# not recognized by all versions of R
Sys.setenv(TZ = 'UTC')
library(photobiology)
library(photobiologyWavebands)
library(photobiologyInOut)
library(lubridate)
library(ggplot2)
library(ggmap)
library(ggspectra)
```

```
options(dplyr.print_max = 5)
options(dplyr.print_min = 3)
```

This package defines functions for importing spectral data from different instruments (Table 1) and simulation models (Table 3).

R function	Instrument	Program
read_ooss_file()	Ocean Optics spectrometers	SpectraSuite
read_oo_jazirrad()	Ocean Optics Jaz	*instrument*
read_oo_jazdata()	Ocean Optics Jaz	*instrument*
read_avaspec_csv()	Avantes spectrometers	*instrument*
read_macam_file()	Macam	*instrument*
read_licor_file()	LI-COR LI-1800	PC1800 (MS-DOS)

Table 1: Functions for importing measured spectral emission data

R function	Simulation model	version
read_tuv_file()	TUV (Sasha Madronich)	version 5.0 (modified)
read_tuv_file()	TUV (Sasha Madronich)	edited output
read_fmi_cum()	(Anders Lindfors)	daily cumulated

Table 2: Functions for importing simulated spectral data from models

R function	R package	function
hyperSpec2mspct()	hyperSpec	import
mspct2hyperSpec()	hyperSpec	export
rspec2mspct()	pavo	import

Table 3: Functions for exchange of data in 'foreign' formats.

2 Examples

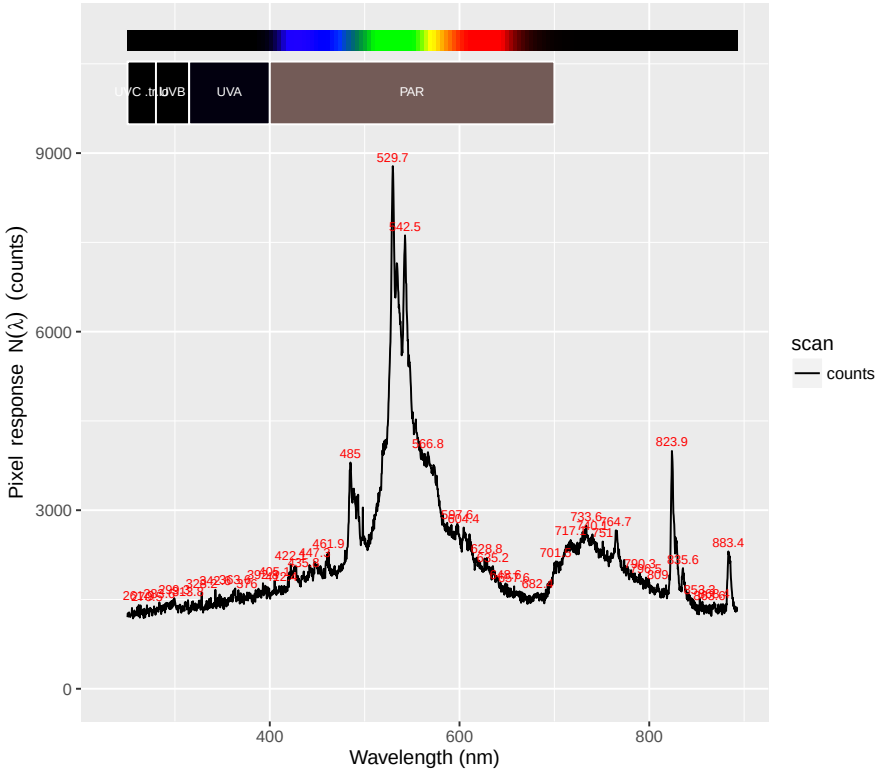
2.1 Ocean Optics Jaz

Reading a raw data file generated by Ocean Optics' Jaz spectrometer. The light source was the Jaz PX pulsed Xenon light module.

```
jazraw.spct <- read_oo_jazdata(file = "data-vignettes/spectrum.jaz")
jazraw.spct <- trim_wl(jazraw.spct, range = c(250, 900))
```

Plotting the spectrum.

```
plot(jazraw.spct)
```



Reading an irradiance file generated by Ocean Optics' Jaz spectrometer. The light source was a 'white' fluorescent tube.

```
jaz.spct <- read_oo_jazirrad(file = "data-vignettes/spectrum.JazIrrad")

## Warning in range_check(x, strict.range = strict.range):  Negative spectral energy
irradiance values; minimun s.e.irrad = -0.032

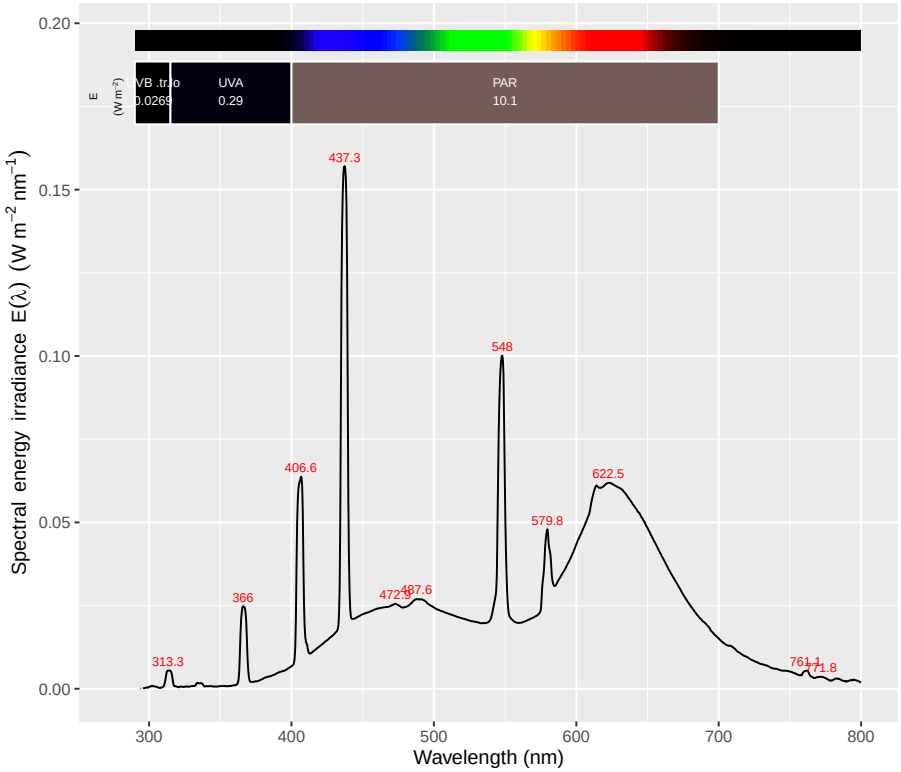
jaz0.spct <- jaz.spct
jaz.spct <- trim_wl(jaz.spct, range = c(290, 800))

## Warning in range_check(x, strict.range = strict.range):  Negative spectral energy
irradiance values; minimun s.e.irrad = -0.032
```

Plotting the spectrum.

```
plot(jaz.spct)

## Warning:  Removed 9 rows containing non-finite values
## (stat_peaks).
## Warning:  Removed 9 rows containing non-finite values
## (stat_wb_irrad).
## Warning:  Removed 2 rows containing missing values (geom_path).
```



We can see that the data have problems. We get a warning because the data contains negative values for spectral irradiance. We will use some methods from package photobiology to correct the problem. As the data are noisy we cannot just shift the scale so that the most negative value becomes zero. Neither can we replace all negative values with zeros, as this would create bias.

In the following code chunk we will use a region of the spectrum in which spectral irradiance is known to be equal to zero as reference to shift the scale zero.

```
jaz.spct <- fshift(jaz0.spct, range = c(255, 290), f = "mean")

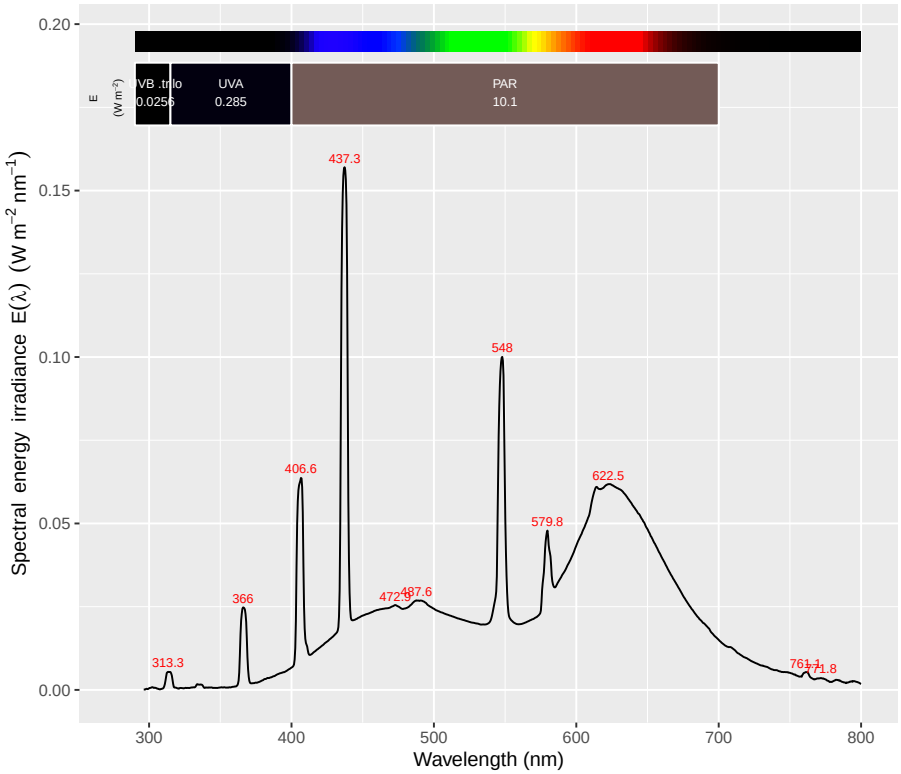
## Warning in range_check(x, strict.range = strict.range):  Negative spectral energy
irradiance values; minimun s.e.irrad = -0.032
## Warning in range_check(x, strict.range = strict.range):  Negative spectral energy
irradiance values; minimun s.e.irrad = -0.00035
## Warning in range_check(x, strict.range = strict.range):  Negative spectral energy
irradiance values; minimun s.e.irrad = -0.00035

jaz.spct <- trim_wl(jaz.spct, range = c(290, 800))

## Warning in range_check(x, strict.range = strict.range):  Negative spectral energy
irradiance values; minimun s.e.irrad = -0.032

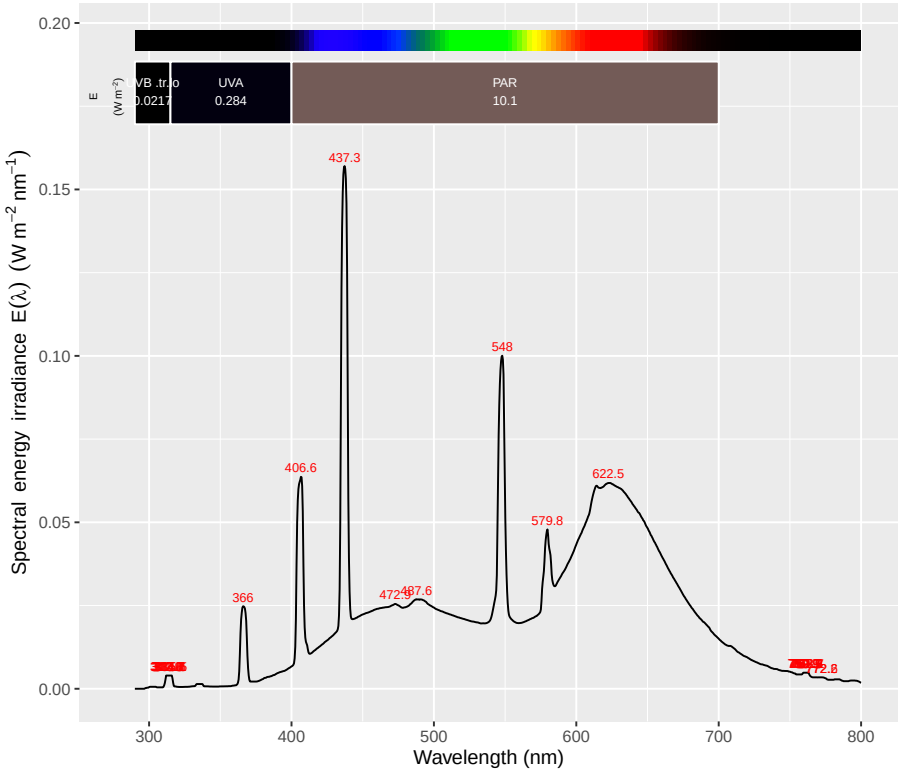
plot(jaz.spct)
```

```
## Warning:  Removed 13 rows containing non-finite values
## (stat_peaks).
## Warning:  Removed 13 rows containing non-finite values
## (stat_wb_irrad).
## Warning:  Removed 9 rows containing missing values (geom_path).
```



We can next try to smooth the spectrum as it is very noisy outside the visible region.

```
jaz.spct <- smooth_spct(jaz.spct)
plot(jaz.spct)
```



Photon and energy irradiances.

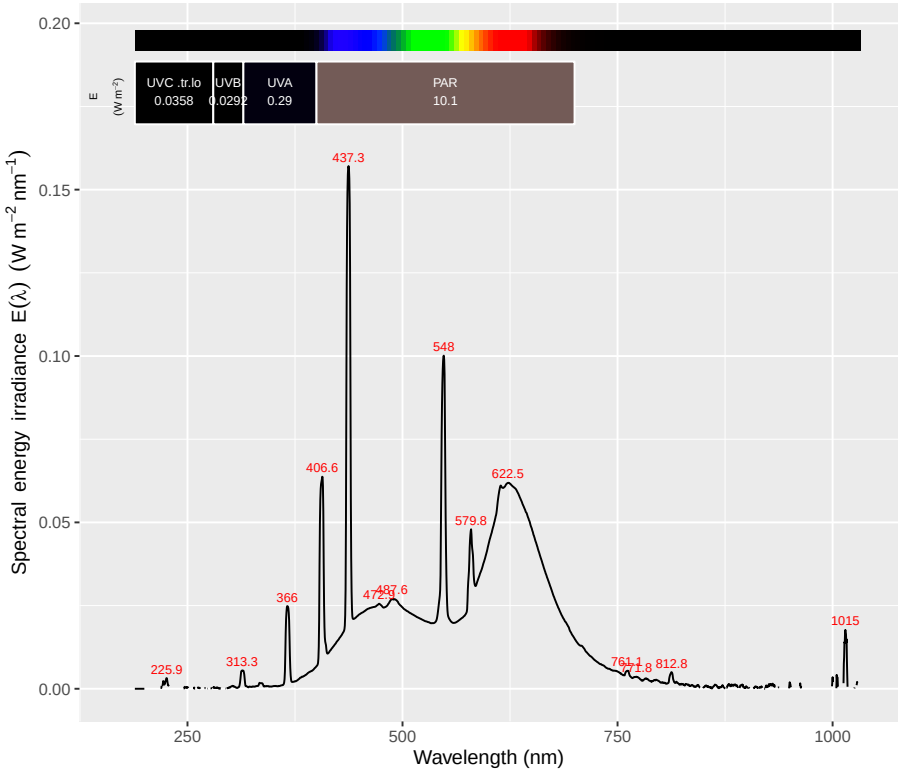
```
e_irrad(jaz.spct, PAR())       # W m-2

##      PAR
## 10.10459
## attr(,"time.unit")
## [1] "second"
## attr(,"radiation.unit")
## [1] "energy irradiance total"
```

All in one statement.

```
plot(read_oo_jazirrad(file = "data-vignettes/spectrum.JazIrrad"))

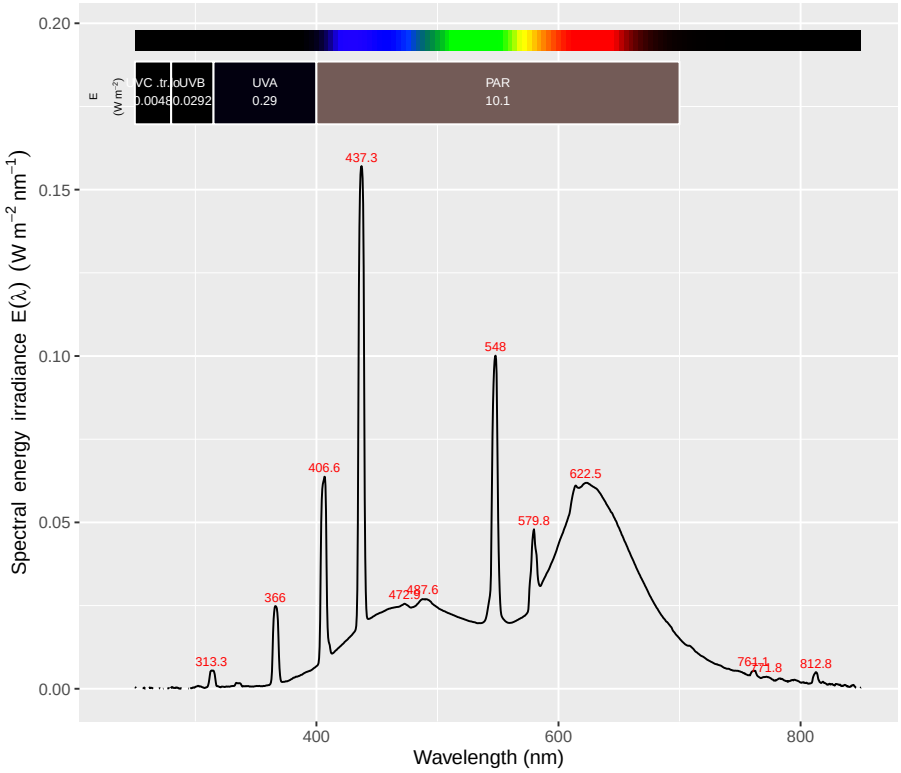
## Warning in range_check(x, strict.range = strict.range):  Negative spectral energy
irradiance values; minimun s.e.irrad = -0.032
## Warning:  Removed 378 rows containing non-finite values
## (stat_peaks).
## Warning:  Removed 378 rows containing non-finite values
## (stat_wb_irrad).
## Warning:  Removed 1 rows containing missing values (geom_path).
```



As above but limiting the wavelength range plotted.

```
plot(read_oo_jazirrad(file = "data-vignettes/spectrum.JazIrrad"),
     range = c(250,850))

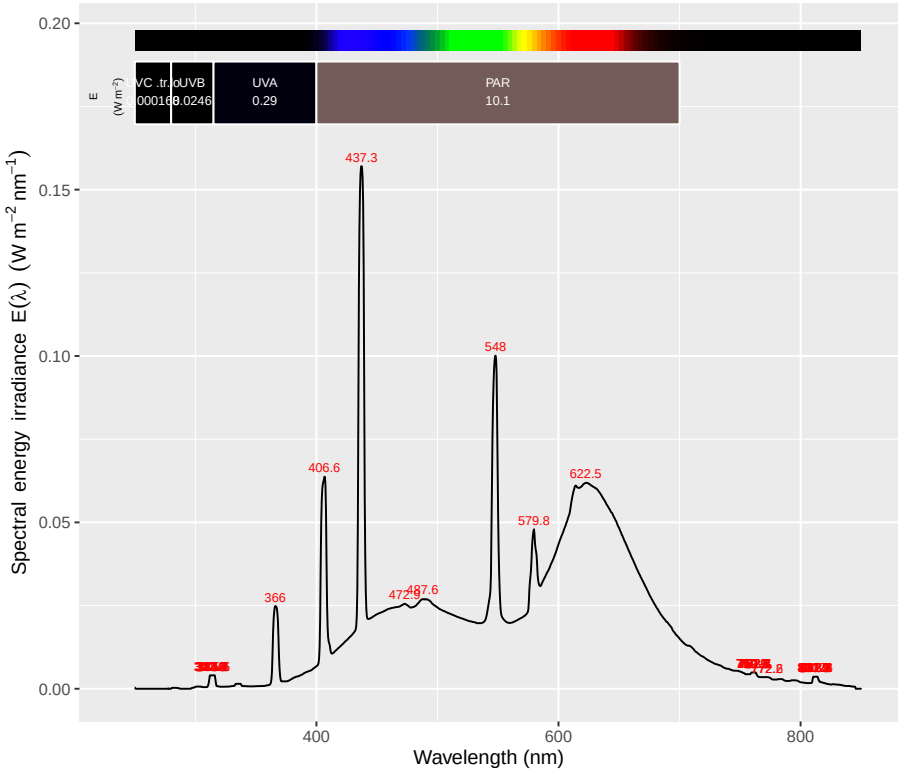
## Warning in range_check(x, strict.range = strict.range):  Negative spectral energy
irradiance values; minimun s.e.irrad = -0.032
## Warning in range_check(x, strict.range = strict.range):  Negative spectral energy
irradiance values; minimun s.e.irrad = -0.032
## Warning:  Removed 52 rows containing non-finite values
## (stat_peaks).
## Warning:  Removed 52 rows containing non-finite values
## (stat_wb_irrad).
```



Adding our custom "adaptive" smoothing.

```
plot(smooth_spct(read_oo_jazirrad(file = "data-vignettes/spectrum.JazIrrad")),
     range = c(250,850))

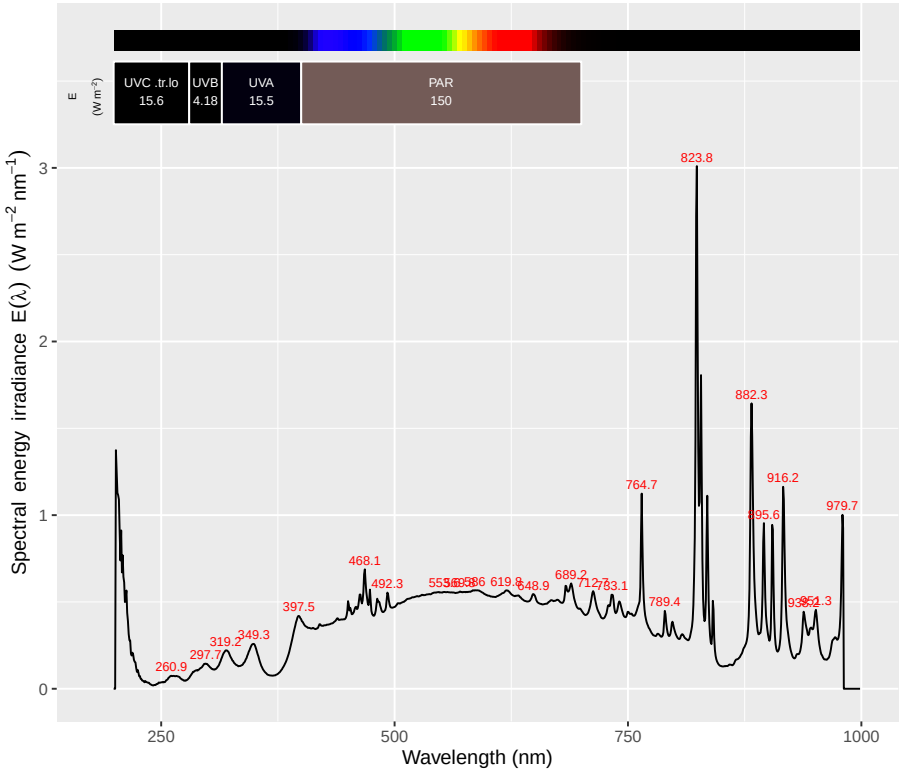
## Warning in range_check(x, strict.range = strict.range):  Negative spectral energy
irradiance values; minimun s.e.irrad = -0.032
## Warning in smooth_spct.source_spct(read_oo_jazirrad(file = "data-vignettes/spectrum.JazIrrad")):
89 'bad' estimates in spectral irradiance
## Warning in range_check(x, strict.range = strict.range):  Negative spectral energy
irradiance values; minimun s.e.irrad = -0.027
## Warning in range_check(x, strict.range = strict.range):  Negative spectral energy
irradiance values; minimun s.e.irrad = -0.027
```



2.2 Other modular spectrometers from Ocean Optics

Now a file from an Ocean Optics' Q6500? spectrometer.

```
plot(read_oo_sstxt(file = "data-vignettes/spectrum.SSIrrad"))
```

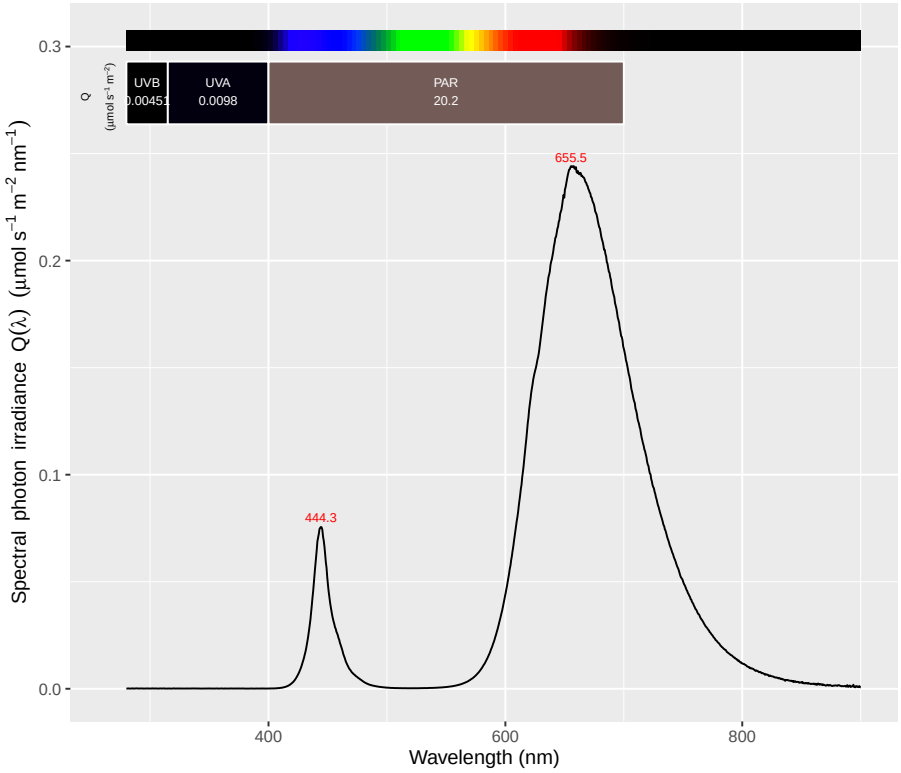


2.3 Modular spectrometers from Avantes

Avantes' two column .csv files can also be imported.

```
plot(read_avaspec_csv(file = "data-vignettes/spectrum-avaspec.csv"),
     range = c(280, 900), unit.out = "photon")

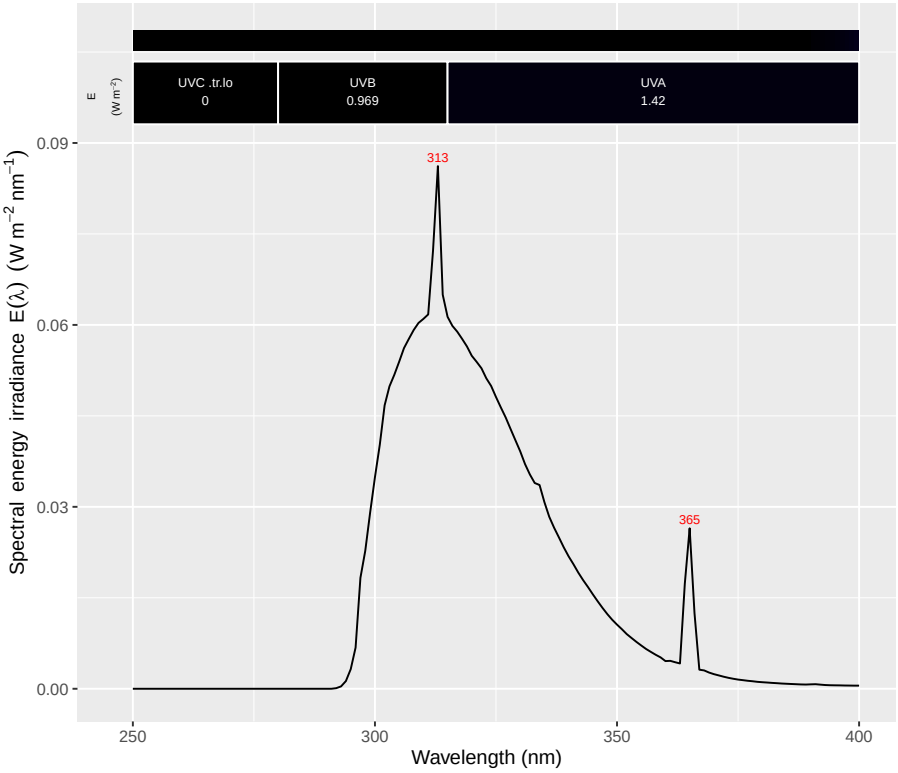
## Warning in range_check(x, strict.range = strict.range):  Negative spectral photon
irradiance values; minimun s.q.irrad = -1.5e-08
```



2.4 Scanning spectrometer from Macam

Macam's single column DTA files can also be imported.

```
plot(read_macam_dta(file = "data-vignettes/spectrum.DTA"))
```



2.5 LI-1800 scanning spectrometer from LI-COR

And a file generated by LI-COR's PC1800 program for the LI-1800 spectroradiometer.

```
licor.spct <- read_licor_prn(file = "data-vignettes/spectrum.PRN")
```

In all cases as much information as possible is decoded, and the data file headers are preserved as comments in the source.spct objects.

```
licor.spct

## Object: source_spct [601 x 2]
## Wavelength (nm): range 300 to 900, step 1
## Measured on: 0000-08-23 16:32:00 UTC
## Time unit: 1s
##
##    w.length s.q.irrad
##       (dbl)     (dbl)
## 1       300 1.518e-10
## 2       301 3.355e-10
## 3       302 2.197e-10
## ..      ...       ...
```

```
cat(comment(licor.spct))
```

```
## LICOR LI-1800:
## "FILE:FL2"
## "REM: TLD 36W/865       (QNTM)"

```

3 Output from simulation models

3.1 TUV

The output from the TUV model can be imported either by editing it before import, or by making a simple edit to the output routine of TUV. This function is known to work with TUV version 5.0 output. The output from TUV can contain a variable number of spectra in "parallel" columns, which are *melted* into a single column, with a factor with letter as levels, a numeric variable with the zenith angle and a POSIXct column with times. A date needs to be always supplied as the output file from TUV has only time of day information.

```
tuv.spct <- read_tuv_usrout(file = "data-vignettes/usrout.txt",
                            date = ymd("2014-03-21"))
summary(subset(tuv.spct, spct.idx == "A"))

## Summary of object: source_spct [482 x 5]

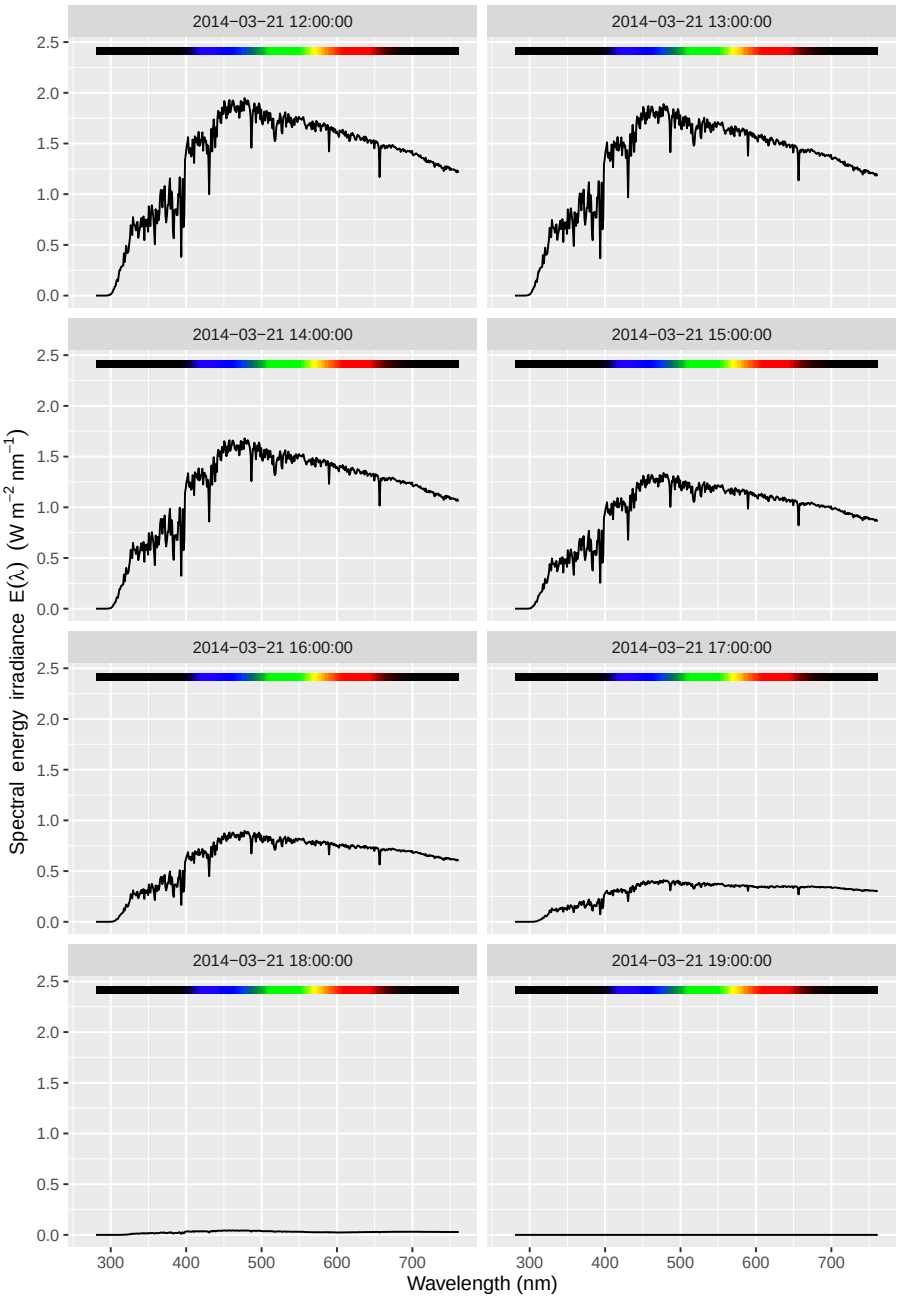
tuv.spct

## Object: source_spct [3,856 x 5]
## Wavelength (nm): range 280.5 to 761.5, step -481 to 1
## Time unit: 1s
##
##    w.length spct.idx s.e.irrad angle
##       (dbl)   (fctr)     (dbl) (dbl)
## 1     280.5        A 3.041e-15 1.829
## 2     281.5        A 1.164e-13 1.829
## 3     282.5        A 1.824e-12 1.829
## ..      ...      ...       ...   ...
## Variables not shown: date (time)
```

It is possible to extract individual spectra with subset, or as done here plot them in different panels.

```
plot(tuv.spct, annotations = c("colour.guide")) +
  facet_wrap(~date, ncol = 2)
```



The output is a single `source_spct` object that can be easily converted into a `source_mspct` object containing the individual spectra as members of the

collection.

```
tuv.mspct <- subset2mspct(tuv.spct)
tuv.mspct

3.2 Models developed by Anders Lindfors

Functions `read_fmi_cum` and `read_m_fmi_cum` can be used to read text files output by a simulation model of solar spectral irradiance. The model was developed at the Finnish Meteorological Institute (FMI) by Dr. Anders Lindfors and collaborators.

We can read an individual file into a `source_spct` object while adding some metadata.

```
z.spct <- read_fmi_cum("data-vignettes/2014-08-21_cum.hel")
class_spct(z.spct)

## [1] "source_spct"  "generic_spct"

getWhenMeasured(z.spct)

## [1] "2014-08-21 UTC"

z.spct

## Object: source_spct [511 x 2]
## Wavelength (nm): range 290 to 800, step 1
## Measured on: 2014-08-21 UTC
## Time unit: 86400s (~1 days)
##
##    w.length    s.e.irrad
##       (dbl)        (dbl)
